

## Culmination of a Constellation

Over any night, stars and constellations in the sky will appear to move from east to west due to the Earth's rotation on its axis. A constellation will *culminate* (reach its highest point in the sky for your location) when it centres on the *meridian* - an imaginary line that runs across the sky from north to south and also passes through the zenith (the point high in the sky directly above your head).

For example:

## When to Observe Constellations

The table shows the approximate time (AEST) constellations will culminate around the middle (15<sup>th</sup> day) of each month. Constellations will culminate 2 hours earlier for each successive month. Note: add an hour to the given time when daylight saving time is in effect. The time "12" is midnight. Sunrise/sunset times are rounded off to the nearest half an hour.

# Charts Depicting Constellations Seen Each Month

These charts can be used to get a rough idea of which constellations are in the sky for any month of the year. The charts are oriented for the southern observer with Celestial South to the top.

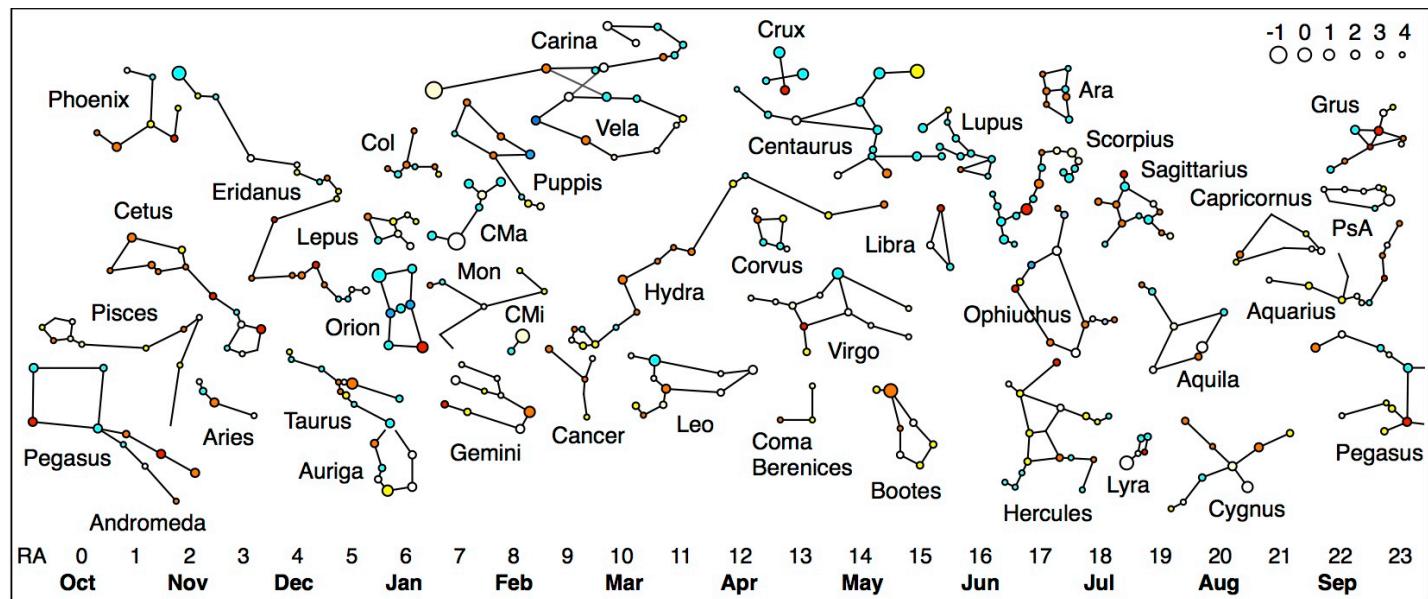

Stars or constellations shown above any even-numbered RA and month will be on the meridian (north/south line through zenith) **at about 10pm (or 11pm daylight saving time) on the 20th day of that month**. This is when the star or constellation is highest in the sky. Note: objects sitting near RA = 0 will be on the meridian at approximately 10pm (11pm daylight saving time) on the 20<sup>th</sup> of October.

## These 12 Constellations are on the Ecliptic

The ecliptic is the path the Sun appears to trace out in the sky.

## This map is similar to the one above but shows more constellations

# Key to Abbreviations for Monthly Observing Targets

Each of the following tables is a list of approximately 45 of the best observing targets for that month. They are designed for southern observers (we are based in Penrith, Western Sydney, Australia). Targets are grouped into their respective constellations (**Con**), which in turn are listed alphabetically. **VMag** is short for Visual Magnitude. C1 – C109 are **Caldwell objects** and M1 – M110 are **Messier objects**.

## Object Types:

**Aster = Asterism of stars.** This is a group of stars that form a recognisable pattern e.g. the Great Square of Pegasus or the Teapot in Sagittarius. However, these stars are generally at very different distances and do not form a gravitationally connected group.

**BS = Binary Star.** Consists of two stars in close proximity to each other, with one star assumed to orbit the other. In reality, many have orbits that have only been partially observed or are so slow that the orbit is only inferred. Separations (Sep) for binary stars is given in arcseconds (").

**CS = Carbon Star.** These are red giants with a high level of carbon compounds in their atmosphere. M-class supergiants such as Antares and Betelgeuse appear more orange than red. However, carbon stars exhibit a noticeable reddish hue. The B-V **colour index** is an indicator of how red a star is. Antares and Betelgeuse have a colour index of 1.9. In comparison, B-V for carbon stars is often greater than 3. The carbon star DY Crucis (near Mimosa) has a colour index of 5.8 and is one of the reddest known stars. Carbon stars are given the classification Cm,n where m is from 0 to 9 (decreasing temperature) and n is from 1 to 5 (indicating the strength of the carbon bands). For example, R Leporis is of type C7,6.

**DS = Double Star.** Includes both optical doubles and binaries. However, here given specifically where it is not known if the two stars form a binary system or it is known that they are an optical double (a chance line of sight) because the stars are at very different distances. Sep in arcseconds.

**GC = Globular Cluster.** A tight group of 10,000s, 100,000s or millions of stars, which pack into a spherical volume. These are the oldest objects in the galaxy, some being around 13 billion years of age. Globular clusters can be classified according to the degree of central stellar concentration. Class 1 globs have the highest degree of central concentration and brighten noticeably towards centre. Class 12 globs are very homogeneous in appearance with no apparent brightening towards centre. Diameters are given in arcminutes (').

**GX = Galaxy.** Excluding the dwarfs, they often contain 100s of billions of stars. Broadly classified into elliptical, spiral or barred spiral galaxies. Dimensions given in arcminutes (').

**MS = Multiple Star.** Three or more stars in the same system. Separations given in arcseconds (").

**NB = Diffuse Nebula.** These are large clouds of interstellar gas and dust. Many, like the Orion Nebula and the Tarantula, are well-known star-forming regions. Dimensions are usually given in arcminutes (').

**OC = Open Cluster.** A family of maybe a few hundred stars loosely tied to each other by gravitation. The stars will generally disperse over a few hundred million years. Size in arcminutes.

**PN = Planetary Nebula.** Many stars, such as the Sun, will eventually expand into red giants and then shrink to become hot white dwarfs. The expanding outer shell of gas and dust left behind at the red giant stage is called a planetary nebula.

**VS = Variable Star.** A star that varies in observed magnitude. This could be due to changes in the star's luminosity as it periodically swells and shrinks or because it has a companion that sometimes eclipses it.

SEPTEMBER	Observing targets by constellation.				
Object	Type	Con	Vmag	Size, Sep, Class	Comments
M2	GC	Aqr	6.5	16' – Class 2	Compact. Large in size.
M72	GC	Aqr	9.3	6' – Class 9	About 3.4 degs from eps Aqr
NGC 7009 – C55	PN	Aqr	8 (star mag 11.5)	30" x 24"	Saturn Nebula. Blue-green.
NGC 7293 – C63	PN	Aqr	7.3 (star mag 13)	15'x12'	Helix Nebula. Large, diffuse.
V Aquilae	CS	Aql	6.6 – 8.4	C6,4	40' from 12 Aql. B-V = 3.9.
NGC 6760	GC	Aql	8.9	7' – Class 9	4 degrees from delta Aquilae.
beta Capricorni	BS	Cap	3.2/6.1	205"	Binocular target (G9/A0).
omi Cap	DS	Cap	5.9/6.7	22"	White optical pair (A3/A7).
rho Capricorni	BS	Cap	5/6.9	1.6"	Tight pair.
M30	GC	Cap	7.2	12' – Class 5	Just 23' from mag 5.2 41 Cap.
NGC 6541 – C78	GC	CrA	6.3	13' – Class 3	Compact. 22' from HJ 5014.
bet Cyg – Albireo	BS	Cyg	3.2/5.1	34"	Orange/blue pair (K3/B8).
61 Cygni	BS	Cyg	5.2/6	31"	Pair of orange dwarfs (K5/K7).
Eastern Veil Neb.	NB	Cyg	5 – NGC 6992/5	60' x 8'	C33. Needs OIII or UHC filter.
gamma Delphini	BS	Del	4.3/5	8.9"	Striking pair (K1/F7).
NGC 6934 – C47	GC	Del	8.9	7' – Class 8	About 3° from kappa Delphini.
NGC 7006	GC	Del	10.6	4' – Class 1	Compact. 8 x dist of Ome Cen.
NGC 7213	GX	Gru	10.1	5' x 4'	Just 16' from Alnair (alp Gru).
NGC 7410	GX	Gru	10.3	6' x 2'	Elongated spiral galaxy.
Grus Quartet	GX	Gru	10.6, 11.5, 11.6	{7' x 3', 3 x 1.2', 10.5}	NGC 7582/90/99 < 13' apart.
				5'x1.6'} - 4'x3.5'	NGC 7552 – 28' from trio.
epsilon Lyrae	MS	Lyr	5.2/6.1//5.3/5.4	2.4", 208", 2.4"	Famous "Double Double".
M56	GC	Lyr	8.3	9' – Class 10	Between gam Lyr & Albireo.
M57	PN	Lyr	8.8 (star mag 16)	84" x 60"	Ring Nebula.
V Pavonis	CS	Pav	6 – 8.1	C6,4	3.3° to bet & del Arae. B-V = 3.5
NGC 6752 – C93	GC	Pav	5.4	20' – Class 6	Fourth brightest in the sky.
M15	GC	Peg	6.2	12' – Class 4	Dense. 4° from Enif.
NGC 7331 – C30	GX	Peg	9.5	11' x 3.7'	Elongated spiral galaxy.
M71	GC	Sge	8.2	7' – Class 11	Loose – weakly concentrated.
M8	NB/OC	Sgr	6? (naked eye)	90' x 40'	Lagoon Nebula.
M17	NB	Sgr	6	46' x 37'	Swan Nebula. Swan 10' x5'.
M20	NB/OC	Sgr	6.3	29' x 27'	Triffid Nebula.
M22	GC	Sgr	5.1	24' – Class 7	Third brightest in the sky.
M28	GC	Sgr	6.8	14' – Class 4	More compressed than M22.
M54	GC	Sgr	7.6	9' – Class 3	Very distant. Mass ~ 47 Tuc.
M55	GC	Sgr	6.3	19' – Class 11	About 8° from tau Sgr.
M69	GC	Sgr	7.6	7' – Class 5	Similar distance to M70.
M70	GC	Sgr	7.8	8' – Class 5	Similar size/luminosity to M69
M75	GC	Sgr	8.5	6' – Class 1	Densely concentrated. Remote.
NGC 6723	GC	Sgr	7	13' – Class 7	30' from eps CrA and BSO 14.
NGC 6818	PN	Sgr	9.4	22' x 15'	Little Gem Nebula. Blue-green.
M11	OC	Sct	5.8	14'	Wild Duck Cluster. Rich.
NGC 6712	GC	Sct	8.1	10' – Class 9	About 2.5° from M11.
Brocchi's Cluster	Aster	Vul	3.6	1.5 degs	Coathanger.
M27	PN	Vul	7.4	8'x5.7'	Dumbbell Nebula.

Con=Constellation, Vmag=Visual Magnitude, Size mostly in arcminutes, Sep=Separation in arcseconds.

Type: Aster=Asterism, BS=Binary Star, CS=Carbon Star, DS=Double Star, GC=Globular Cluster, GX=Galaxy, MS=Multiple Star, NB=Diffuse Nebula, OC=Open Cluster, PN=Planetary Nebula, VS=Variable Star.

OCTOBER	Observing targets by constellation.				
Object	Type	Con	Vmag	Size, Sep, Class	Comments
gam And - Almach	BS	And	2.2/5	9.8"	Orange/blue pair (K3/B8).
pi Andromedae	BS	And	4.3/7.1	36"	Contrasting pair (B5/A6).
AQ Andromedae	CS	And	7.5 – 9.5	C5,4	B-V = 3.5. Between pi & sigma.
M31/M32/M110	GX	And	3.4, 7.9, 8	190' x 60'	Andromeda Galaxy + Satellites.
NGC 7662 – C22	PN	And	8.3 (star 12 – 16)	30"	Blue Snowball. Blue-green.
Zeta 2,1 Aquarii	BS	Aqr	4.3/4.5	2.1"	Twin white pair (F2/F2).
41 Aquarii	BS	Aqr	5.6/6.7	5.2"	(K0/F2) 3.6° from Helix Neb.
M2	GC	Aqr	6.5	16' – Class 2	Compact. Large in size.
M72	GC	Aqr	9.3	6' – Class 9	About 3.4° from eps Aqr.
NGC 7009 – C55	PN	Aqr	8 (star mag 11.5)	30" x 24"	Saturn Nebula. Blue-green.
NGC 7293 – C63	PN	Aqr	7.3 (star mag 13)	15'x12'	Helix Nebula. Large, diffuse.
beta Capricorni	BS	Cap	3.2/6.1	205"	Binocular target (G9/A0).
omi Cap	DS	Cap	5.9/6.7	22"	White optical pair (A3/A7).
rho Capricorni	BS	Cap	5/6.9	1.6"	Tight pair. 3.5° from bet Cap.
M30	GC	Cap	7.2	12' – Class 5	Just 23' from mag 5.2 41 Cap.
bet Cyg – Albireo	BS	Cyg	3.2/5.1	34"	Orange/blue pair (K3/B8).
61 Cygni	BS	Cyg	5.2/6	31"	Pair of orange dwarfs (K5/K7).
Eastern Veil Neb.	NB	Cyg	5 – NGC 6992/5	60' x 8'	C33. Needs OIII or UHC filter.
gamma Delphini	BS	Del	4.3/5	8.9"	Striking pair (K1/F7).
NGC 6934 – C47	GC	Del	8.9	7' – Class 8	3° from kappa Delphini.
NGC 7006	GC	Del	10.6	4' – Class 1	Compact. 8 x dist of Ome Cen.
NGC 7213	GX	Gru	10.1	5' x 4'	Just 16' from Alnair (alp Gru).
NGC 7410	GX	Gru	10.3	6' x 2'	Elongated spiral galaxy.
Grus Quartet	GX	Gru	10.6, 11.5, 11.6	{7' x 3', 3 x 1.2', 10.5 5'x1.6'} - 4'x3.5'	NGC 7582/90/99 < 13' apart. NGC 7552 – 28' from trio.
Eps Peg - Enif	DS	Peg	2.5/8.7	145"	Wide contrasting pair (K2/F8).
M15	GC	Peg	6.2	12' – Class 4	Dense. About 4° from Enif.
NGC 7331 – C30	GX	Peg	9.5	11' x 3.7'	Elongated spiral galaxy.
psi1 Piscium	BS	Psc	5.3/5.5	30"	Similar white stars (A1/A0).
65 Piscium	BS	Psc	6.3/6.3	4.2"	Yellowish twins (F5/F4).
TX (19) Piscium	CS	Psc	4.5 – 6.4	C7,2	Bright. B-V = 2.7.
M74	GX	Psc	9.1	10' x 9.3'	Face-on spiral. Very diffuse.
gam PsA	BS	PsA	4.5/8.2	4"	Contrasting. 48' from del PsA.
del PsA	BS	PsA	4.2/9.2	4.5"	About 3° from Fomalhaut.
HCG 90: NGC 7172	GX	PsA	11.9 (6' to 7173)	2.5' x 1.4'	Brightest HCG. Four galaxies.
NGC 7173/76 +74			11.4, 11.4, 13.3	Ellipticals 1'x1'	Two ellipticals + twisted spiral
NGC 55 – C72	GX	Scl	7.8	30' x 6'	Similar visual size to NGC 253.
NGC 253 – C65	GX	Scl	7.1	28' x 7'	Can be seen with binoculars.
NGC 288	GC	Scl	8.1	14' – Class 10	1.8° from NGC 253.
beta 1,2,3 Tuc	BS	Tuc	4.3/4.5//5.1	27", 549"	Striking trio (B9/A2/A0).
47 Tuc – C106	GC	Tuc	4	30' – Class 3	Massive. 2nd only to ome Cen.
NGC 362 – C104	GC	Tuc	6.6	13' – Class 3	Just north of the SMC.
SMC (NGC 292)	GX	Tuc	2.3	5 x 3 degrees	Small Magellanic Cloud.
Brocchi's Cluster	Aster	Vul	3.6 – bino target	1.5 degs	10 stars form the Coathanger.
M27	PN	Vul	7.4 (star 13.5)	8' x 5.7'	Dumbbell Nebula.

Con=Constellation, Vmag=Visual Magnitude, Size mostly in arcminutes, Sep=Separation in arcseconds.

Type: Aster=Asterism, BS=Binary Star, CS=Carbon Star, DS=Double Star, GC=Globular Cluster, GX=Galaxy, MS=Multiple Star, NB=Diffuse Nebula, OC=Open Cluster, PN=Planetary Nebula, VS=Variable Star.
